```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer I and primer II (see AAV30329) were used in PCR amplification of develop PCR probes for the isolation of geranium and rose 1-aminocycloproane-1-carboxylate synthase (ACC synthase) cDNA clones (see AAV30324-26 and AAV30330). The invention relates to the use of antisense fragments of these genes to control ACC synthase expression in plants. By reducing the amount of ACC synthase produced in plant cells, the rate of ACC conversion to ethylane can be decreased. This can be used to prolong the shelf-life of cent flowers and to reduce leaf yellowing and petal abscission be the conversion of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ranu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-OCT-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the isolation of promoter DNA from geranium (Pelargonium x hortorum) genomic clone PHSacc49 (gPHSacc49). This promoter represents the ACC (1-aminocyclopropane-1-carboxylate) synthase gene promoter. The promoter is useful to regulate the transcription level of a coding sequence in geranium and other plants. The present sequence represents a PCR primer used to amplify a DNA fragment of geranium PHSacc genes.

                                                                                                                                                                                                                                                               l-aminocyclopropahe-1-carboxylic acid; ACC synthase; p flowering; inhibition; regulation; development; fruit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to nucleic acids (I) that hybridise under stringent conditions to any of 999 sequences (AB065424-AB066422) or their fragments. (I) are used to express the corresponding polypeptides (II) or to produce genetically modified plant cells or transgenic plants, which may have improved resistance to disease or stress, or altered metabolic/biosynthetic pathways (for production of commercial, nutritional or medicinal products), or generally any trait of interest, or can be used to screen for biologically active agents (e.g. fungicides, nosecticides and antibiotics).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO at segdata.uspto.gov/sequence.html?DocID=999999770149.

The present invention describes a transgenic variety of pineapple in which initiation of flowering is inhibited, the variety of pineapple in which initiation of flowering is inhibited, the variety comprising a nucleotide sequence encoding an ACC synthase enzyme where the nucleotide sequence is operably linked, in the sense or antisense orientation, to one or more regulatory nucleotide sequences. The ACC synthase gene can be used to regulatory nucleotide sequences, the ACC particularly for inhibiting initiation of flowering. Such plants can then be induced to flower in a narrow spectrum of time which would thereby decrease the spread of fruit maturity within a crop.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents the nucleotide sequence encoding a l-aminocyclopropane-l-carboxylic acid (ACC) synthase enzyme of pineapple. The present invention describes a transgenic variety of pineapple in which initiation of flowering is inhibited, the variety comprising a nucleotide sequence encoding an ACC synthase enzyme where the nucleotide sequence is operably linked, in the sense or antisense orientation, to one or more regulatory nucleotide sequences. The ACC synthase gene can be used to regulate pineapple plant development, particularly for inhibiting initiation of flowering. Such plants can then be induced to flower in a narrow spectrum of time which would thereby decrease the spread of fruit maturity within a crop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated ACC synthase genes from pineapples - used to generate transgenic pineapples in which the natural initiation of flowering is inhibited
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (GOLD-)

It was obtd. by PCR amplification (see also AAT33140) of broccoli floret cDNA. The PCR product was cloned into pCR11 to obtain clone TA31. cDNA or genomic DNA (see also AAT33136) can be inserted, in sense or antisense orientation, into an expression cassette and then transferred to a binary vector suitable for Agrobacterium-mediated plant transformation. The constructs permit control of the level of ACC synthase in a transgenic plant (esp. B. oleracea or Cucumis melo) and hence a control of maturation, ageing and shelf-life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding 1-amino:cyclo:propyl-1-carboxylic acid synthase of Brassica oleracea - used to regulate ethylene-dependent processes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a novel gene, acacci, which encodes an ACC synthase. The enzyme ACC synthase is involved in the pathway for ethylene biosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechan.cal wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants using either sense or antisense expression system may be used to control the regulation of plant development, in particular fruit ripening, reducing senescence and thus improving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mangifera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mangifera indica ACC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                involved in the pathway for ethylene biosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants the regulation of plant development, in particular fruit ripening, reducing senescence and thus improving storage life.

The enzyme ACC synthase is involved in the pathway for ethylene biosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants using either sense or antisense expression system may be used to control the regulation of plant development, in particular fruit ripening,
                                                                                                                                                                                                                                                                                                                                                                                                                      ACC synthase; S-adenosyl-L-methionine methylthioadenosine lyase; capaccl; ethylene biosynthesis; transgenic plant; senescence; antisense expression system; plant development; fruit ripening; EC 4.4.1.14; papaya; multigene family; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a novel gene, capaccl, a member of the papaya ACC synthase multigene family. ACC synthase is an enzyme involved in the pathway for ethylene biosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants using either sense or antisense expression system may be used to control the regulation of plant development, in particular fruit ripening, reducing senescence and the particular fruit ripening, reducing senescence and the particular fruit ripening.

                                                                                                                      2 DNA sequences (AAT66246-47) respectively code for 1-aminocyclopropahe carboxylage synthases (ACC synthase) GAC-1 (AAW09878) and GAC-2 (AAW09878), enzymes involved in the biosynthesis of ethylene in plants. In a method for the commercial production of transgenic plants, Agrobacterium vectors carrying antisense to inoculate periole explants of amother plant, pref. Pelargonium x domysticum. The resulting callus is cultured and used to regenerate transgenic plants. The antisense genes for ACC synthase or ACC oxidase (see also AAT66248) are used to regenerate transgenic plants. The antisense genes prevent ACC synthase or ACC oxidase expression and hence ethylene formation and fruit ripening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants using either same or antisense expression system may be used to control the regulation of plant development, in particular fruit ripening, reducing senes:eace and thus improving storage life.

Brassica oleracea genomic clone ACCA1 (AAT33136) codes for 1-aminocyclopropyl-1-carboxylic acid synthase (ACC-synthase) (AAR98598), an enzyme involved in ethylene biosynthesis. It was obtd. by subjecting broccoli leaf total genomic DNA to PCR using primers (see also AAT33137-38) based on the Arabidopsis thaliana ACC synthase gene. The product was cloned into pCRII to obtain clone ACCA1. Genomic DNA (see also AAT33139) can be inserted, in sense or antisense orientation, into an expression cassette and then transferred to a binary vector suitable for Agrobacterium-mediated
                                                                                                                                            DNA encoding 1-amino:cyclo:propyl-1-carboxylic acid synthase of Brassica oleracea - used to regulate ethylene-dependent processes in plants, esp. to improve shelf life
                                                                                                                                                                                                                                                                                                        07-JUN-1995;

                                                                                                                                        The ACC synthase cDNA was isolated from C.pepo using a novel method. • A cDNA expression library was prepared from induced plant tissue. The library was screened with an antibody preparation obtained by partially purifying the induced ACC synthase and using it to immunise a suitable mammal. Immunoreactive clones were isolated and sequenced. One of these, pACCl, contained an open reading frame corresponding to a protein of 493 amino acids and mol. wt. 55.779 kD. See also AAQ15132-Q15140.

(Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent web site at www.derwent.com/dwpi/updates/ntis_us.html.)

                                                                                                                                                                                                                                                                                                                                               Primer II and primer I (see AAV30328) were used in PCR amplifications to develop PCR probes for the isolation of geranium and rose 1-aminocycloproane-1-carboxylate synthase (ACC synthase) cDNA clones (see AAV30324-26 and AAV30330). The invention relates to the use of antisense fragments of these genes to control ACC synthase expression in plants. By reducing the amount of ACC synthase produced in plant cells, the rate of ACC conversion to ethylene can be decreased. This can be used to prolong the shelf-life of cut flowers and to reduce leaf yellowing and petal abscission
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated ACC synthase genes - are obtained from geranium and rose, used to develop products for producing plants with reduced ethylene levels, for increasing shelf-life

                                                                                                                                                                                         The present invention relates to the isolation of promoter DNA from geranium (Pelargonium x hortorum) genomic clone PHSacc49 (gPHSacc49) This promoter represents the ACC (1-aminocyclopropane-1-carboxylate) synthase gene promoter. The promoter is useful to regulate the transcription level of a coding sequence in geranium and other plant: The present sequence represents a PCR primer used to amplify a DNA fragment of geranium PHSacc genes.
                                                                                                                                                                                                                                                                                                                                                                                          New promoter from the 1-aminocyclopropane-1-carboxylase synthase of geranium, useful to regulate level of transcription of coding sequence in geranium and other plants

(I) are used to express the corresponding polypeptides (II) or to produce genetically modified plant cells or transgenic plants, which may have improved resistance to disease or stress, or altered metabolic/biosynthetic pathways (for production of commercial, nutritional or medicinal products), or generally any trait of interest, or can be used to screen for biologically active agents (e.g. fungicides, insecticides and antibiotics).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO at sequence.html?DocID=999909770149.
Producing transjebic plants, with reduced climacteric ethylene prodn. - to give flowers and buds, specifically carnations, with increased post-harvest life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gorlach J,

White Sim. It was obtd. by PCR amplification of carnation cDNA using primers (AAT38899-900) based on highly conserved regions of the ACC synthase gene.

Transgenic carnation plants carrying the non full-length gene show reduced prodn. of ACC synthase or ACC synthase-specific mRNA as a result of co-suppression. This leads to decreased climacteric ethylene prodn. by the plant and hence delayed senescence of flowers and buds after cutting, and increased post-harvest life.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of an ACC synthase multigene family found in mango. ACC synthase is involved in the pathway for ethylene biosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants using either sense or antisense expression system may be used to control the regulation of plant development, in particular fruit ripening,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1088

ŧ

This sequence represents a novel gene, capaccl, a member of the papaya ACC synthase multigene family. ACC synthase is an enzyme involved in the pathway for ethylene biosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               substantially the rate of ethylene production. Endogenous ethylene i often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plant using either sense or antisense expression system may be used to cor the regulation of plant development, in particular fruit ripening, reducing senescence and thus improving storage life.

Best L
This sequence represents cDNA encoding human ATP-dependent serine proteinase 31. The protein has a molecular weight of 31 kD. The inven relates to human ATP-dependent serine proteinase 31 (AAG66837), nucle of ATP-dependent serine proteinase 31 kD. The recombinant produc of ATP-dependent serine proteinase 31. The present invention addition discloses an antagonist of ATP-dependent serine proteinase 31 for therapeutic use, and an antibody which specifically binds to ATP-dependent serine proteinase 31. ATP-dependent serine proteinase 31, a nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HTV (human immunodeficiency virus) infection, immune disorders and inflammatory conditions. The protein may also be used to screen for modulators of activity or for paptide fingerprinting identification. The polynucleo
                                                                                                                                                                                                                                                                                                                                                                                           Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                         Human adenosine triphosphate dependent serine proteinase 31 and encoded polynucleotide, applicable in diagnosis and treatment of malignant tumor, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ATP-dependent serine proteinase 31; recombinant production; malignant tumour; cancer; blood disease; HIV infection; human immunodeitichency virus; immune disorder; inflammatory condit cytostatic; anti-HIV; antiinflammatory; immunomodulator; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              24-MAR-2000; 200qcn-0115085

                      2 DNA sequences (AAT66246-47) respectively code for 1-aminocyclopropane carboxylase synthases (ACC synthase) GAC-1 (AAW09879) and GAC-2 (AAW09879), enzymes involved in the biosynthesis of ethylene in plants. In a method for the commercial production of transgenic plants, Agrobacterium vectors carrying antisense genes for ACC synthase or ACC oxidase (see also AAT66248) are used to inoculate peticle explants of a mother plant, pref. Petargonium x domesticum. The resulting callus is cultured and used to regenerate transgenic plants. The antisense genes prevent ACC synthase or ACC oxidase expression and hence ethylene formation and fruit ripening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 can be used as probe for hybri microarrays.

                                                                                                                                                                                                                                                                           The gene encoding detriment induced 1-aminocyclopropane-1-carboxylic acid (ACC) synthetase (EC 4.4.1.14) was obtod by screening a cDNA library prepd. from Cucurbita maxima mRNA. EC4.4.1.14 obtd. from cDNA library clones was screened by an antibody method to identify colonies producing EC 4.4.1.14, e.g. E.coli DH5 alpha/pCMW33. Biosynthesis of ethylene is controlled by ACC synthetase. Ethylene controls the growth, maturing and aging of higher plants.

A cDNA expression library was prepared from induced plant tissue. The library was screened with an antibody preparation obtained by partially purifying the induced ACC synthase and using it to immunise a suitable mammal. Immunoreactive clones were isolated and sequenced. One of these, pACC1, contained an open reading frame corresponding to a protein of 493 amino acids and mol. wt. 55.779 kD. See also AAQ15132-Q15140.
(Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information please visit the Derwent web site at www.derwent.com/dwpi/updates/ntis_us.html.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA

1-aminocyclopropane-1-carboxylic acid (ACC) synthase clone pACC1.
pACC1 was used in the isolation of conserved sequences from five tomato (LE-ACC 1A, LE-ACC 1B, LE-ACC 2, LE-ACC3 and LE-ACC4) and two zucchini (CP-ACC 1A) and CP-ACC 1B) ACC synthases.
A novel DNA molecule comprises an expression system which, when contained in a plant host cell, generates RNA that is sufficiently complementary to an RNA transcript of an endogenous ACC synthase gene to prevent its synthesis. The expression system consists of the reverse transcript of the antisense RNA (i.e. cDNA) operably linked to control sequences that effect its transcription into the antisense RNA, where the cDNA can be amplified from the endogenous ACC synthase gene by primer pairs encoding conserved ACC synthase sequences. The DNA molecule can be used to delay ripening of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          02-APR-1992;

ACC synthase are capable of catalysing the conversion of AdoMet (S-adenosyl methionine) to ACC and methyl thioadenosine (MTA). ACC DNA is useful for producing ACC synthase which is essential for the production of ethylene in higher halfs, where ethylene is a determinant of fruit ripening. The ACC DNA is also useful for producing transgenic plants which are overproducers of or are deficient in ACC synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1254 CAAACTCGAAACCAACCTGGCTC 1232
Expression cassette for producing transgenic plants exhibiting inhibited ethylene production and delayed fruit ripening, comprise complementary RNA which inhibits 1-aminocyclopropane-1-carboxylic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1-aminocyclopropane-1-carboxylic acid (ACC) synthase is essential for the production of ethylene in higher plants; ethylene is a determinant of fruit ripening. The present invention relates to an expression cassette which comprises the reverse transcript of RNA complementary to an RNA transcribed from ACC synthase gene. The expression cassette can be used to prevent ACC gene expression. The expression cassette is useful for inhibiting ethylene production and fruit ripening, when introduced into plant or plant cells. The present sequence is the coding sequence for zucchini ACC synthase clone pACC1.
The invention relates to two isolated cDNA molecules ((pASC6) and (pACOS7)) encoding 1-aminocyclopropane-1-carboxylic acid synthase (ACS) and an ethylene forming enzyme (EFE), respectively. The clones are deposited under the Accession Numbers NCIMB 40813 and NCIMB 40814, respectively. pASC6 and pACOS7 may be used to genetically control ethylene biosynthesis in plants and hence regulate the ethylene-induced processes involved in fruit ripening (and other ethylene related processes). Vectors comprising the cDNA sequences may be used to produce transgenic bananas with altered fruit ripening characteristics. The orientation of the pASC6 and pACOS7 used in the construct, will determine the tripening process is affected. If the genes have a sense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAX27501 standard; cDNA;

If genes encode antisense mRNA, they will inhibit the expression of the genes involved in fruit ripening and hence slow the process down (down-regulation). In this manner different spatial and temporal patterns of genes expression can be produced. Retardation of the rate of ripening will reduce the rate of deterioration of banana fruit after harvest. This helps in production of high quality fruit that has improved flavour and texture. The present sequence represents the cDNA sequence of the banana ACS enzyme.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
